Abstract

We use letters legislators write to a bureaucratic agency (the Federal Energy Regulatory Commission) to study congressional attempts to influence bureaucratic decisions. We build on Arnold (1979)’s insights into how bureaucrats and legislators *anticipate* how others will react to their actions. Drawing on thousands of letters from legislators to the agency sent over nearly two decades, we find that these letters are filled with specific references to companies that legislators seek to assist or about which the legislator’s constituents have complaints. We explore which legislators seek to influence the agency, on whose behalf they make requests, and what outcome they attempt to influence. Finally, we match these letters with campaign finance records to see whether legislators’ behavior correlates with the campaign contributions they receive from the energy industry. We find that Republicans and those who receive money from the energy-sector write relatively more letters on behalf of energy companies, but not on behalf of constituents, while Democrats write comparatively more letters in opposition to energy companies.

1 Introduction

Concern over the potential for campaign contributions to influence policy-making has been a central question in American politics for several decades. Much of the academic research in this area has focused on whether campaign contributions influence legislators’ roll call votes. While these numerous studies have produced somewhat mixed results, on the whole, the answer appears to be no: that most of the time campaign contributions don’t influence how a member votes in the context of a roll call vote. While the focus on roll call votes is perhaps unsurprising given the availability of the data, this precise availability and visibility make them a poor vehicle for those seeking to quietly influence the policy-making process who may not want to draw scrutiny from journalist or constituents.

Compared to the intense scrutiny to roll call votes, scholars have paid much less attention to congressional advocacy and oversight activities, such as letter-writing—when legislators write letters to government bureaucracies urging them toward or against some decision.¹ While these letters are technically subject to federal open records act requirements, the disclosure process is often slow and laborious, meaning that, in practice, these letters rarely see the light of day and are highly unlikely to draw public scrutiny. Thus letter-marking may be a preferred vehicle for those seeking to quietly influence specific government decisions through campaign contributions.

In this paper, we build on our earlier work (Judge-Lord et al., 2018) to deeply examine one agency – the Federal Energy Regulatory Commission. We explore whether legislators’ letters to the commission appear motivated by constituency service or campaign contributions. Specifically, we investigate whether corporate campaign contributions from political action committees in the energy sector to legislators are correlated with legislator’s letter-writing to the agency on behalf of those companies. To preview our results, we find that Republicans and those who receive money from energy-sector write relatively more letters on behalf of energy companies, but not on behalf of constituents, while Democrats write comparatively more often in opposition to a company. To some extent, these results capture a general focus on energy issues; writing all kinds of letters, not just pro-business letters, is positively correlated with energy-sector campaigning contributions both in particular electoral cycles and legislative session and over a legislator’s career. There is some evidence, however, that elected officials who receive more money from the industry in a cycle write more on behalf of companies than against them in the following legislative session.

¹This has begun to change in the last few years with recent studies by Mills and Kalaf-Hughes (2015); Ritchie (2017); Lowande (2018); Lowande et al. (2018).

2 Arnold’s Impact: Studying Congress-Bureaucracy

We use letter marking activity to study how members of Congress attempt to influence agency decisions. Arnold’s classic book *Congress and the Bureaucracy: A Theory of Influence* profoundly influences this project—just as it influences nearly every paper that examines how Congress and the bureaucracy interact to allocate funds. Like much of Arnold’s work *Congress and Bureaucracy* builds a theory of bureaucrats and legislators who *anticipate* how others will react to their actions. Members of Congress anticipate how constituents will react to their behavior and bureaucrats anticipate how the decisions they make will affect members of Congress.

While the idea that legislators anticipate how their constituents will react is developed most completely in *The Logic of Congressional Action*, *Congress and Bureaucracy* contains the early version of these ideas (Arnold, 1990, 1979). Arnold makes clear that legislators are forward-thinking when he argues that “[f]requently the problem is to anticipate how one’s constituents might react in some future election rather than to discern on where they stand on some issue today” (Arnold, 1979, 27). Service to the district is valuable, Arnold argues, because it serves the needs of reelection. Not only do funds allocated to the district provide legislators with the opportunity to impress the direct beneficiary, but they also provide the opportunity for legislators to broadly claim credit for the allocation of resources to the district. The same logic applies to regulatory decisions that bring private investment to the district. Regulatory decisions permit construction of new infrastructure, creating opportunities for profit and, perhaps, jobs and require investments in mitigating harms, also possibly creating jobs and other local benefits.

The key requirement, Arnold argues, for elected officials to create the impression that they were pivotal in governmental decisions, is to create the impression that they fought for their constituent’s interests. This may be particularly true for moneyed interests seeking a return on their investments in elected officials’s campaigns. Donors who allocate funds to elected officials may be particularly interested in seeing that elected officials will fight for their district—and the donor’s—interests when important decisions are made in the federal bureaucracy. As a result, even if letters have little effect on bureaucratic decisions, Arnold’s argument in *Congress and the Bureaucracy* suggests that the impression that letters sent from members of Congress to bureaucrats can help legislators cultivate the impression of influence in order to court funding and support in future elections. Legislators write letters on behalf of donors or constituents, then, in anticipation of how donors and voters will react.

Like legislators who anticipate the responses of key constituents, bureaucrats anticipate how legislators will react to their decisions. The literature on bureaucratic decision-making builds on Arnold’s idea of bureaucratic anticipation. For example, bureaucrats cultivate (and then deploy) their reputation by anticipating

how key constituencies will react to the agency’s decisions (Carpenter, 2002)

Even agencies like FERC that have a relatively high degree of autonomy have reason to be concerned with how members of Congress will react to their decisions. First, even though FERC is self-funding, Members of Congress must still approve appropriations, allowing Congress to constrain how the agency uses its budget, potentially making it difficult for the bureaucrats to pursue their policy goals. Second, if FERC drifts too far away from Congressional priorities, agency staff might reasonably anticipate a statutory revision that reallocates some of FERC’s regulatory authority to another agency. Finally, even in the absence of those drastic actions, bureaucrats could expect that key members of Congress could make it more difficult for the agency to conduct its business through oversight hearings or investigations.

In *Congress and the Bureaucracy*, Arnold argues that bureaucrats anticipate the reaction of elected officials to their decisions. But in the minutia of day to day regulatory decisions, bureaucrats may lack information about the strength of legislator preferences. When legislators write legislator to the bureaucracy, they may help overcome this information problem. Anticipating a legislator’s preferences based on the Bureaucrat’s own knowledge of legislators, their fundraising networks, and their districts will necessarily result in an imprecise inference about what legislators want. The a legislator’s letter can substantially increase the precision of the bureaucrat’s inference about what legislators want. Thus, while letters from individual members may themselves lack formal authority, in light of Arnold’s insights about mutual anticipation, the information they contain about constituent, donor, and legislator preferences on specific regulatory decisions becomes a potentially import part of congressional interactions with the bureaucracy.

Arnold’s key insights of anticipation—that actors are forward-looking when making decisions, reacting to how the world might be rather than how it is right now—provides the background for understanding why letters to FERC will matter for legislators and bureaucrats alike. With this notion of anticipation in mind, we turn to the literature on the influence of money in politics.

3 Studying the Influence of Campaign Contributions on Congressional-Bureaucratic Relations

Attempting to study the influence of campaign contributions on political outcomes is fraught with a host of methodological and observational challenges. As two of us (Powell and Grimmer) have written previously, two of the primary challenges to studying the influence of money on the most visible form of congressional behavior (roll call votes) are legality and visibility (Powell and Grimmer, 2016). Turning first to the issue of legality, as the U.S. Office of Government Ethics (2013) describes, if something of value is given, offered, or

promised with the intent “to influence any official act,” it is illegal behavior on the part of the contributor. Similarly, on the recipient side, if a public official demands, seeks, receives, or accepts an item of value, it is illegal behavior on the part of the legislator. Given these potential threats of prosecution and jail time we might expect both campaign contributors and politicians to avoid public actions that could be construed in such a way.

This brings us to the issue of visibility. To the extent both campaign contributors who might be seeking favors and elected officials who might be seeing campaign contributions are concerned about legal appearances, we might expect elected officials to avoid taking visible public actions that might be viewed as potentially compromising. Rather both the elected officials and the campaign contributors might prefer actions that achieve the same desired end but in a less observable arena. As we will elaborate in the following section, much of the research on money in politics has focused on highly visible outcomes such as roll call votes, which for these very reasons are the least likely places the protagonists would want to connect themselves. For these connected reasons of legality and visibility, we believe congressional letter-writing to bureaucratic agencies may prove a fertile field of work. These letters, that we have obtained through laborious Freedom of Information Act requests are not generally available to the public, and both legislators and campaign contributors may not be aware that they are documents that may be accessible. Certainly, they are rarely accessed and thus those actors hoping to fly under the radar may prefer them to more overt legislative acts.

Finally, before turning to a review of the previous research on the influence of money in American politics, we want to add a necessary note of caution about the conclusions we can draw in this paper. This project is an observational study that looks at the correlation between campaign contributions and attempts to influence the Federal Energy Regulatory Commission through legislative letters. Given our research design, we cannot draw conclusive causal findings, but rather can explore relationships that might be promising areas for future research with a more robust causal design.

3.1 Findings: Previous Research on the Influence of Money

There has been extensive scholarship devoted to examining the influence of money on American politics. One finding that appears frequently in the literature is that donors appear to contribute in ways consistent with short term access seeking (Snyder, 1992; Romer and Snyder, 1994; Powell and Grimmer, 2016; Barber, 2016; Fourinaies and Hall, 2018).

Yet, the evidence that legislators undertake actions explicitly for donors is limited. There are some exceptions. First, there is the contributions to congressional committees literature, where it is clear that corporations donate to pivotal legislators’ congressional committees (Powell and Grimmer, 2016; Berry and

Fowler, 2018). But it should be noted that this literature fails to connect the contributions to key actions in the institution. In addition to showing that donors appear interested in short-term access-seeking and contribute to those members influential in policy areas relevant to their business interests, work by Kalla and Brookman (2016) show that donors are more likely to get meetings with key members of Congress. This finding is again consistent with this short-term access-seeking behavior, though again, there is no connection to what legislators are actually doing in the institution.

Considerable scholarly attention has been devoted to exploring whether campaign contributions influence roll-call votes in Congress (Ansolabehere et al., 2003; Roscoe and Jenkins, 2005; Calcagno and Jackson, 1998; Chappell, 1982; Conley and McCabe, 2012; Engel and Jackson, 1998; Fleisher, 1993; Grenzke, 1989; Milyo et al., 2000; Jones and Keiser, 1987; Kau and Rubin, 1982; Langbein and Lotwis, 1990; Lessig, 2011; Moore et al., 2013; Neustadt, 1990; Saltzman, 1987; Stratmann, 1991, 1992, 1995, 2002; Wawro, 2001; Wright, 1985, 1989, 1990, 2004). Although the findings aren't entirely consistent in this area, the vast majority of studies fail to find an impact of campaign contributions on roll call voting. Of course, as we discussed in the preceding section, given the fact that both campaign contributors and elected officials may be concerned by issues of legality and visibility, we have reason to be skeptical of finding this in the highly visible roll call votes.

Instead, research by Hall (1996) and subsequent work argues that we have to look at lower levels of Congressional action to detect the influence of corporations. Building on this logic, subsidy theory of lawmaking suggests that donors will subsidize legislators to take actions that advance legislators explicit goals. Letter marking is a place where we could expect to find this influence of campaign donations. In line with Arnold's argument of the anticipated benefits of particularistic spending, legislators already might have incentive to advocate for the interests of within district donors. Not only will a project authorized by FERC direct financial benefits to the district, it will also provide the elected official with the opportunity to claim credit for the expenditure (Arnold, 1979; Grimmer et al., 2014). Within the set of projects, then, it is reasonable to expect that elected officials will prioritize those that come from donors, if the projects are otherwise comparable.

There is relatively little work specifically examining the links between campaign contributions, legislators, and the bureaucracy. One notable exception is Gordon and Hafer (2005), which develops a formal model of the strategic and signalling complexity of these relationships and finds that large corporate donors overseen by the Nuclear Regulatory Commission are both less compliant and less monitored by the bureaucracy.

3.2 How Corporations Can Make Campaign Contributions

Let us now turn from the existing literature on the influence of money to the question of how corporations can make campaign contributions. The campaign financing landscape has undergone substantial transformation over the last several decades. Perhaps the area of greatest change is the regulation surrounding how corporations (and other business entities) can engage in political activity. As the Federal Election Commission's *Campaign Guide for Corporations and Labor Unions* describes:

“The Federal Election Campaign Act (the Act) generally prohibits corporations ... from using their general treasury funds to make contributions to federal candidates, federal accounts of political party committees, and other political committees (PACS). 52 U.S.C. §30118(a). They may, however, fund independent expenditures, contribute to political committees established solely to finance independent expenditures (e.g., Super PACs), contribute to the non-contribution accounts of Hybrid PACs, and establish separate segregated funds (SSFs),”(Federal Election Commission, 2018, pg.1).

Thus there are a variety of methods that companies can engage in political activities. In this paper we will focus on what the Federal Election Commission calls Separate Segregated Funds (SSFs), which are more commonly called corporate-sponsored political action committees (PACs) (Federal Election Commission, 2018). These corporate PACs may raise money in order to make contributions to federal candidates as well as and expenditures on behalf of federal candidates and committees. The full name of the company (also called the connected organization or sponsoring company or organization) must appear in the name of the company's PAC. The connected organization is the organization (corporation) that establishes, administers or financially supports the PAC. The Connected Organization may exercise control over the corporate PAC. Note that if a connected organization has parent companies/subsidiaries those names don't need to be included in the name of the SSF.

4 Why Study the Federal Energy Regulatory Commission?

Like many agencies within the federal bureaucracy, The Federal Energy Regulatory Commission (FERC) makes policy and enforcement decisions that have major consequences for jobs, lives, profits and the cost of the commodities it regulates. FERC regulates electricity markets, oil and gas pipelines, hydropower projects, and liquified natural gas export projects. The commission's decisions have major implications for business profits and for the consumers they serve. For example, because many natural gas pipelines cross state lines, FERC largely controls pipeline market entry. Similarly, because electricity grids are regional, conflicts between electric-generating companies and state regulators or regional transmission organizations are often appealed to FERC. FERC regulations and their application thus impact the prices that consumers

pay for electricity, the reliability of the electric grid, and the ability of new companies to enter markets largely controlled by FERC-authorized and regulated monopolies.

In many ways, FERC is a hard case to find congressional influence. It was designed to be largely insulated from political influence. FERC is self-funding. It is authorized to collect revenue by the Federal Power Act (FPA) and the Omnibus Budget Reconciliation Act of 1986. These revenues fully offset FERC’s appropriations, potentially making FERC more independent from Congress than agencies who must compete for limited tax revenue.

FERC is also more independent from presidential power than most agencies, further insulating it from political negotiations between Congress and the President. While technically in the Department of Energy, FERC is structured as an independent non-partisan commission. The five commissioners are appointed to staggered 5-year terms, and no more than three can be from a one party. A majority of the Commission at any given time may not have been appointed by the sitting president, and even when the president has appointed a majority, the commission may not support the administration’s priorities. For example, in 2018, the Commission, a majority of whom were appointed by President Trump, rejected the administration’s proposal to provide special support Coal and Nuclear power plants by requiring consumers to pay higher rates for electricity from these sources.

Yet, like many agencies, FERC receives hundreds of letters from Members of Congress each year. Because FERC’s decisions are so consequential to energy company profits, its record-keeping for external communication is meticulous, presenting a particularly good opportunity for a case-study of congressional letter-writing where we can be confident that the data are relatively free from the selection problems that plague records of congressional correspondence with other federal agencies.

5 Theory: What Motivates Legislator Letter-marking Activity

In this paper we explore two potential motivations for why legislators would write to federal agencies in general, and to FERC in particular: 1) that legislators are acting on behalf of constituents and 2) that legislators are acting on behalf of donors (corporate interests).

5.1 Why Might Legislators Act on Behalf of Constituents?

One of the earliest and most comprehensive academic descriptions of constituency service comes from Richard Fenno in his classic book *Home Style: House Members in Their Districts*. As Fenno describes:

Many activities can be incorporated under the rubric of ‘district service,’ or ‘constituent service,’

but the core activity is providing help to individuals, groups, and localities in coping with the federal government. Individuals need someone to intercede with the bureaucracies handling their veterans' benefits, social security checks, military status, civil service pension, immigration proceedings, and the like. Private groups and local governments need assistance in pursuing federal funds, for water and sewer projects, highways, dams, buildings, planning, research and development, small business loans, and so forth (Fenno, 1978, pg. 101).

While the definition that Fenno presents is broad, the central element is clear – assisting constituents (individuals or groups) in interacting with government agencies. Fenno's description is consistent with how Cain et al. (1987, pg. 2) characterize constituency service as acting as an “ombudsman” for constituents vis-a-vis the administrative state. These scholarly definitions of constituent service from (Fenno, 1978) and Cain et al. (1987) are consistent with how legislators understand the concept today, and according to a recent Congressional Research Service Report constituency service “is commonly considered a representational responsibility” (Eckman, 2017). Before proceeding to discuss why legislators perform constituency service in the following section, it is worth noting that this definition of constituency service is an expansive one that encompasses both individual casework activity (e.g. requests for assistance with a social security check) and district- or group-level advocacy. It does not hinge on a precise definition of which individuals and groups count as constituents. Representatives may advocate for groups that are organized and intense demanders of government benefits or protections (e.g. support for a local union facing a factory closing) or merely linked by a common fate (e.g. general support for hurricane recovery aid in the district). The key distinction in this notion of constituent service is that it is an act of service to a particular individual or group at a particular time, rather than a broad or enduring policy that may apply to many groups over time.

To understand why legislators engage in constituency service, we turn to the broader literature on what motivates Members of Congress? The classic answer comes from Mayhew (1974). In *Congress: The Electoral Connection*, Mayhew argues that re-election is the primary (or at least the proximate) motivation because it is a necessary step to achieve other goals (such as policy or power within Washington). Constituency service activity has traditionally been viewed as a way to improve one's re-election prospects by assisting individual (or groups of) constituents. As Cain, Ferejohn, and Fiorina (1984) and Cain, Ferejohn, and Fiorina (1987) describe, constituency service helps to build a member's “personal vote” which they defined to be the “portion of a candidate's electoral support which originates in his or her personal qualities, qualifications, activities, and record,” (Cain, Ferejohn, and Fiorina, 1987, pg. 9). In their survey of congressional staffers, Cain et al. (1987) found that the overwhelming majority of staffers believed that constituency service activity has electoral payoffs by positively contributing to a legislator's “personal vote.”

5.2 Why Might Legislators Act on Behalf of Donors?

To answer why legislators might act on behalf of donors we return again to Mayhew (1974)’s argument that re-election is the proximate motivation of most legislators, because it is necessary to achieve other goals. While constituency service – helping individual voters– may incrementally (voter by voter) improve a legislator’s electoral prospects, the campaign contributions a legislator receives can be used in a myriad of ways to potentially boost a legislator’s campaign. While the political science literature disagrees on the impact of campaign spending and political campaigns more generally on electoral outcomes, few politicians would dispute the widely held view among political practitioners that campaign funds help members win re-election.

6 Letter Writing & FOIA Data

To examine the relationship between campaign contributions and letter-writing activity, we assemble a new dataset of legislator-agency contacts covering a wide array of government agencies and broadest time frame to date. We submitted FOIA request for all records of communication from Members of Congress and their staff to all cabinet departments, their component agencies, and 34 independent agencies for the period from 2007-2017. For some agencies, like the Federal Energy Regulatory Commission, we received data from a longer time period.

As of August 2018, all departments except for the State Department and Department of Veterans’ Affairs have provided records, though we are still processing the majority of records from the Departments of Defense and Energy, and the majority of Department of Justice components have either not yet granted our request or claimed that they do not track congressional correspondence. Some components provided records that duplicated records from the Secretary’s office, for example in the Department of Agriculture where several such component records were dropped. As for independent agencies, we are waiting on records from the SEC, OPM, MSPB, FTC, FLRA, NSF, NRC, U.S. Export-Import Bank, CPSC, CFPB, CFTC, CIA, and Appalachian Regional Commission. The remaining 21 independent agencies have provided records, though some are still in the process of reviewing and releasing additional records. Of these, 18 have been sufficiently cleaned, coded, and linked with other data source for inclusion in this analysis.

Upon receiving records, we extracted names matching variations on the names of members of Congress and matched them to other datasets such as ideology scores (Lewis et al., 2018), committee membership (Stewart and Woon, 2017), and committee oversight (Lewis and Selin, 2012). We also made a considerable effort to verify and update committee membership data.

In this paper we draw on both on general patterns of legislator letter writing across all agencies and particularly on letters sent to the Federal Energy Regulatory Commission. For the Federal Energy Regulatory Commission, we obtained all 7600 letters received by FERC and marked “congressional” since 1990. Most, but not all of these are from Members of the U.S. Congress. For this paper, we focus on 4308 of these letters from 2000-2018. Many of these letters are co-signed, which for the purposes of this paper (identifying patterns in contacts between legislators and FERC) we are treating as equivalent to writing the letter. Including the co-signed letters yields 6988 members-level observations for years 2000-2018.

6.1 Examples of FERC Letters

The Federal Energy Regulatory Commission is one of the less well known federal agencies. To give readers a sense of the activities FERC oversees and the type of issues raised in congressional letters to the agency we’ve included a selection of example letters in the appendix.

6.1.1 Example of Energy Project Advocacy

As we explore in detail in the next section of this paper, many legislator letters to FERC focus on advocating on behalf of an energy project or other corporate interest. In recent years, one of the legislators most focused on advocating for energy-related projects was Rep. Alex Mooney (R-WV). Rep. Mooney was elected to Congress in 2014 and since that time has spent considerable time advocating for energy projects in West Virginia. In the lead-up to the 2016 congressional elections, the Charleston Gazette-Mail wrote an article highlighting the money he had received from energy companies and the approvals those companies were seeking from FERC for various projects under consideration. They wrote, “Dominion is trying to get the Atlantic Coast Pipeline, which would run through national forests in West Virginia, approved by the Federal Energy Regulatory Commission. Columbia Pipeline Group is hoping to have three interstate pipeline projects of its own approved by the same federal agency,”(Brown, 2016, pg.4). Indeed, our data show that Mooney wrote to FERC more than any other agency, always on behalf of energy projects, mostly pipelines.

In 2015 Rep. Mooney wrote on behalf of the Columbia s Mountaineer XPress Project, and Atlantic Coast Pipeline ACP project. In 2017, he wrote on behalf of the Dominion Energy Supply Header Project, National Fuel Gas Distribution Corporation’s Northern Access Project, Transcontinental Gas Pipe Line Company’s Atlantic Sunrise Project, Columbia Gas Transmission’s proposed Eastern Panhandle Expansion project, Columbia’s WB Xpress Project to build new compressor stations. In addition to the tens of thousands of dollars these companies spent on Mooney’s campaign, the parent companies of these projects spend millions of dollars on lobbying (Kim, 2018).

Figure A2 in the Appendix shows one of the letters written by Rep. Mooney advocating for energy projects. In this case the letter clearly connects both the the name of the project and the name of the company involved with the project. Many letters lack that linkage and list only the project name, leaving us to draw those linkages. Later in the paper we'll discuss how we make those connections across projects, subsidiary companies and parent companies.

6.1.2 Example of Constituent Service Letter

Another frequently seen type of legislator advocacy to FERC is a constituency service letter— a letter in which the member advocates on behalf of a constituent. Figure A1 in the Appendix shows an example of this type of letter. In this case we observe Senator Susan Collins (R-ME) advocating on behalf of a constituent who is concerned that Florida Energy and Light is “attempting to take over the driveway of his business and make it a public way.”²

6.1.3 Example of Personal Business Interest

In some cases, legislators appeared motivated by personal business concerns. For example, in 2014 former Florida Senator and Governor Bob Graham wrote to FERC regarding an issue that affected his family's farming business.³ The full text of this letter is in Figure A3 in the Appendix.

7 What Are Congressional Letters to FERC About?

Our first question was to explore on whose behalf the legislator was writing to the bureaucracy, and how letter-writing to FERC different from letter-writing to all other agencies. We classified letters into four categories: Constituency Service on behalf of an individual, Constituency Service on behalf of a Company, Letters on behalf of a non-profit or local government, and finally letters about policy-issues. To classify such a large volume of letters, we relied on a combination of hand-coding and some inductively-developed automated coding rules applied to letters that were not put in either group by human coders.⁴

²Certain passages of this constituency service letter in Figure A1 have been blacked out. In this case, as we frequently observe in these letters, the constituent's name and personal information has been redacted for privacy reasons

³See <http://miamilakes.com/AboutGraham/Overview.aspx> for a discussion of Senator Graham's relationship to the farm in question.

⁴We developed a [codebook](#) to classify correspondence by type and to identify referents such as agency rules, hearings, or legislation. Our coding process began with the authors coding a representative sample of records. We then trained undergraduate RAs, graduate RAs and free-lance coders. The first several thousand letters or log entries were double coded. For example, of over 10,000 log entries for the Environmental Protection Agency, the first 2,500 were double-coded with an inter-coder agreement of 0.9 where coders did not flag their coding as uncertain and .78 overall. Throughout the hand-coding process, we also developed subagency-specific coding rules where certain regular expressions indicated certain types of correspondence. For example, where “rulemaking” consistently indicated that a legislator's request involved an agency rule, all cases yet uncoded by hand for that agency are assigned to be type “Policy-Rulemaking” for the present analysis.

Before presenting our analysis, we should note that we define constituents broadly such that they need not be in a member’s district. For example, Representative Tauscher of Wisconsin wrote to the Defense Commissary Agency on behalf of the Jelly Belly Candy Co., based in California. Jelly Belly was then “given a chance to resolve issues” with their contract. This was coded as “Corporate Constituent Service” and included in our broader measure of constituent service. This definition of constituent is, unfortunately, a matter of necessity, because most agencies redact constituent’s names and addresses for privacy reasons unless the constituent signed a release waiver.

We also consider constituent service as broader than casework. For example, Senator Rubio asking the IRS for special treatment for residents of hurricane-affected parts of Florida was coded as “Individual Constituent Service.” We note these “hard cases” to illustrate the boundaries of our coding scheme. Most contacts were more easily parsed into either individual casework or policy work related to hearings, regulations, and legislation.

Figure 1 below shows how letter-writing to FERC compares to letter-writing to all other agencies. The x-axis shows our four categories of letters: 501c3 (i.e. non-profit) or local government, corporate constituent, individual constituent, and policy. The y-axis shows the percentage of letters that were of that type. The dark purple bars are for letters written to FERC (which is a subsidiary of the Department of Energy) and the mustard color bars are for the overall averages across all agencies that we have previously coded. The numbers on top of each bar represent the total number of letters represented by the percentages. For example, to interpret the figure, across all agencies over 60% of letters were written on behalf of constituents (67,081 letters), but for FERC only about 35% of their letters were written on behalf of constituents (1,505 letters). Across all⁵ agencies, most letters (just over 60%) are written on behalf of individual constituents, followed by letters on behalf of local governments or non-profits, followed by policy-related letters, and finally letters on behalf of corporate constituents. (Judge-Lord et al., 2018).

In contrast to the overall patterns we observe in letter-writing to all agencies, we find very different patterns of activity in letter-writing to the Federal Energy Regulatory Commission. We observe much less constituent service and advocacy on behalf of local governments and non-profits, and much greater levels of corporate advocacy and policy-related work. Notably, while in the aggregate data letter-writing on behalf of corporate constituents is the least common form of letter-writing activity, nearly 45% of the letters to FERC are on behalf of corporate interests.

We can learn more by considering not just who the letter is written on behalf of, but also what the letter is advocating for or against. In Figure 2 below the left panel looks at of the letters written to FERC on

⁵We say all agencies here to indicate all the agencies that we have currently processed. While we do not believe there are systematic differences between the agencies we have and have not processed, these numbers are subject to change as we process the remainder of the agencies.

Figure 1: The Distribution Across Types of Congressional Requests FERC vs. All* Agencies. The x-axis shows our four categories of letters: 501c3 (i.e. non-profit) or local government, corporate constituent, individual constituent, and policy. The y-axis shows the percentage of letters that were of that type. The dark purple bars are for letters written to FERC (which is a subsidiary of the Department of Energy) and the mustard color bars are for the overall averages across all agencies that we have previously coded. The numbers on top of each bar represent the total number of letters represented by the percentages.

behalf of individual constituents, what the letters were actually advocating for. We break the subjects into four categories: Against a named business (Antibusiness), In favor of a named business (ProBusiness), Both against and for named businesses, and Other. It is worth noting that Other here is a catch-all category that may include advocating for or against specific regulations which may benefit (or harm) a business, but no business names were mentioned in the letter. The right-hand panel breaks down letters into the same four categories, but only looks at letters written on behalf of non-constituents (i.e. all other types of letters).

In sum, Figure 2 provides strong evidence that most constituent letters are advocating against businesses rather than in favor of businesses. In contrast to the constituent letters, most non-constituent letters advocate in favor of named businesses.

Figure 2: What Types of Letters are Supportive of Businesses? The left panel shows letters written to FERC on behalf of individual constituents and the right panel shows letters written to FERC on behalf of non-constituents. The bars show what those letters were actually arguing for substantively broken down into four categories: against a named business (Antibusiness), in favor of a named business (Probusiness), both for and against named businesses (Both), and Other (other is a catch-all category that may include advocating for or against specific regulations which may benefit (or harm) a business, but no business names were mentioned in the letter).

8 What Members Attempt to Influence FERC?

We begin our exploration of what members attempt to influence the Federal Energy Regulatory Commission by examining the legislators most active in their communications with FERC. Figure 3 below shows the most active legislators and their letter-writing activity over time (2000-2018). The top panel shows the most active Senators and the bottom panel shows the most active Representatives. Each hash mark indicates the legislator wrote a letter on that date.⁶

As the bottom panel of Figure 3 shows, Rep. Virgil Goode was one of the most active House letter-writers to FERC.⁷ Interestingly, his letter-writing activity was largely focused on FERC with over 67% of his total letters (across all agencies) written to FERC. During the period of his greatest letter-writing intensity, electric utility companies (i.e. those overseen by FERC) were one of his greatest sources of campaign contributions. The letters Rep. Goode wrote to FERC illustrate the challenge of linking issues discussed in the letters to campaign contributions. Rep. Goode's letters mention the Smith Mountain project, Appalachian Power,

⁶In interpreting this figure, readers should be aware that some of the members listed in the table weren't in the chamber for the entire period, so blank stretches at the end or beginning of the line may indicate the member was out of office during that period.

⁷Also of note is that Rep. Goode is one of the relative few party-switchers in recent congresses. He switched from a Democrat to Independent prior to the 2000 election, and then switched from Independent to Republican prior to the 2002 election.

Figure 3: Legislators Writing the Most Letters to FERC. The top panel shows the Senators who wrote the most letters to FERC and the bottom panel shows the Representatives who wrote the most letters to FERC. Each hash mark indicates the legislator wrote a letter on that date. Note that many members listed in the table weren't in the chamber for the entire period, so blank stretches at the end or beginning of the line may indicate the member was out of office during that period.

AEP, and American Electric Power. These are all project and subsidiary companies related to the same parent company American Electric Power (also referred to as AEP).

Next we turn to examining differences in letter-writing activity by party and majority-minority status in Figure 4 below. The upper left-hand panel shows for the time the Democrats controlled the majority of the chamber, what percentage of letters they wrote to FERC were on behalf of constituents and what proportion were advocating on behalf of businesses. The upper right-hand panel shows the same proportions

for when Republicans controlled the majority, the lower right-hand panel shows the proportions for when the Republicans were in the Minority, and the lower left-hand panel shows the proportions for when the Democrats were in the Minority.

Figure 4: Who Writes on Behalf of Constituents vs. Business? By Party and Majority Status. The upper left panel represents of letters to FERC Democrats wrote while they were in the majority, what percentage were advocating on behalf of constituents and what percentage were advocating on behalf of businesses. The upper right panel shows the same proportions for Republicans while they were in the majority, the lower right for Republicans while they were in the minority, and the lower left for Democrats while they were in the Minority.

In dis-aggregating letter-writing activity by party and majority status in Figure 4, we observe that the parties behave differently from each other, and they behave differently themselves when they're in the majority versus when they're in the minority. When Republicans control the majority they write approximately 65% of their letters to FERC advocating on behalf of named businesses. By contrast to when the Republicans are in the majority, when the Republicans are in the minority those ratios flip, and they write nearly 65% of their letters on behalf of constituents.

We observe very different letter-writing activity for the Democrats. When the Democrats are in the majority, they write approximately 55% of their letters on behalf of constituents – notably different than Republicans in the majority who were primarily advocating on behalf of companies while in the majority. When Democrats lose majority status, their advocacy moderately changes, so that they write more than half of their letters on behalf of businesses. It is notable that while both parties change their behavior when they move from the majority to the minority, the change in behavior is substantially greater for Republicans.

9 Demand Driven Letter-writing?

One of the challenges of our approach to studying legislative letter-writing to federal agencies is that we don't observe the demand for letters from constituents or businesses. In an ideal world, we'd want to be able to measure and control for demand for letters. However, since our project covers both the U.S. House and the U.S. Senate, we can take advantage of the large differences in state population to proxy for the demand for letter-writing from constituents. For example, in 2018 the most populous state of California had a population of 39,557,045, while the least populated state of Wyoming had a population of only 577,737 (Wikipedia, 2019). Thus California's population is approximately 68 times that of Wyoming, and it is not unreasonable to assume that California's senators receive more requests for constituency service than Wyoming's senators.

In our research across federal agencies, we typically see senators from larger states doing more constituency service than senators from smaller states. Figure 5 below shows average Senate letter-writing by state population. The top panel Senate letter-writing to all agencies in which we observe this positive relationship between state population and Senate letter-writing to all agencies. The bottom panel shows the relationship between state population and only Senate letter-writing to FERC.⁸ The figures include lowess smoothing trend lines and 95% confidence intervals.

By comparing across letter-writing to all agencies (the top panel) and letter-writing only to FERC (the bottom panel), in Figure 5 we see a weaker relationship between state population and letter-writing to FERC than we observed in the agency-wide data as a whole. While Figure 5 shows the name and state of high-letter writing outlier Senators, it is difficult to identify the amount of letters coming from each state in the figure. To more clearly highlight what states show the highest level of senatorial letter-writing Figure 6 shows the number of Senate letters to FERC by state. The left-panel shows a heat map for the total number of letters written to FERC from senators from that state, while the right-panel shows a heat map for senatorial letter-writing to FERC adjusted by state population (per million residents). The lighter colors

⁸Readers should be careful in noting the differences in y-axis scales between the two panels of this figure.

Figure 5: State population and Senate Letter-writing. The top panel shows average Senate letter-writing to all* agencies by state population, and the bottom panel shows the average Senate letter-writing to FERC by state population. The figures include a lowess smoothing trend line and 95% confidence intervals.

show greater intensity of senatorial letter-writing from that state.

As we saw in Figure 5 there is only a weak relationship between state population and senatorial letter-writing to FERC. The left-hand panel of Figure 6 shows that while some senators from highly populated

Figure 6: FERC Contacts from Senators by State. The left panel shows the total number of FERC contacts from senators by state. The right panel shows the contact per million residents from senators by state. Lighter colors show greater letter-writing activity.

states write a lot of letters such as senators from California and New York, other highly populated states such as Florida barely register. Once we adjust for state population (a rough proxy for constituent demand), and turn our attention to the right-hand panel in Figure 6, we see that Senate letter-writing from California and New York no longer stands out.

After adjusting for state population, we see that the most active letter-writing senate delegations hail from Maine, Vermont, Wyoming, Rhode Island, and Montana. While some of these population-adjusted state leaders may be a surprise, others seem consistent with the role the energy sector plays in the state’s economy. For example, Wyoming is per capita the top energy producing state in the country with substantial reserves of oil and natural gas (Wyoming State Geologic Survey, 2019).

10 Congressional Committee Oversight and Letter-writing

Turning from the question of how constituent demand (i.e. population) to the role of institutional position, in this section we explore how policy-relevant committee chairs interact with FERC. Given FERC’s role regulating interstate transmission of electricity, natural gas, and oil, we identified two policy-relevant committees in each chamber of Congress. In the House we examine the House Energy and Commerce Committee and the House Natural Resources Committee. In the Senate we examine the Senate Committee on Energy and Natural Resources, and the Senate Committee on Environment and Public Works. Figure 7 below shows the letter-writing activity of committee chairs of policy-relevant committees both before, during, and after their time as chair.

As we can see in Figure 7, committee chairs of policy-relevant committees wrote a lot of letters to FERC. This is particularly true for the Energy and Commerce Committee in the House and the Senate Committee

Figure 7: Committee Chairs Attempting to Influence FERC. Each hash mark indicates the legislator wrote a letter on that date. The solid horizontal lines indicate the period for which that member was a committee chair, the dashed horizontal lines indicate the period for which that member was ranking member (top minority party leader) of the committee. Note that many members listed in the table weren't in the chamber for the entire period, so blank stretches at the end or beginning of the line may indicate the member was out of office during that period.

on Energy and Natural Resources, which is the more policy relevant committee for each chamber, and whose chairs were active letter writers before, during and after their time as chair

11 Exploring the Relationship between Letter-writing and Campaign Contributions

Next we turn to a preliminary analysis of the relationship between the PAC contributions a legislator receives from the energy sector and the legislator's letter-writing activity to FERC.

11.1 Measuring Industry Money

To begin this exploration, in this paper we are focusing exclusively on campaign contributions from political action committees in the energy sector. To do this we rely on two data sources. First, we draw on campaign

contribution data from Bonica’s Database on Ideology, Money in Politics, and Elections (Bonica, Adam, 2016). Second, we use the Center for Responsive Politics’ classification of PACs into industries to identify relevant PAC contributions. Given our focus on the Federal Energy Regulatory Commission and the jurisdiction of that Commission, we are including in our totals all political action committees they classify as Oil, Gas, or Energy Utility. Using these two sources we can create an industry-specific total of PAC contributions to a given member in an election cycle. Collectively this covers 428 PACs in the energy sector (oil, gas, and electricity), which we then match to their PAC contributions to each member of congress.

Figure 8 below shows the average amount a member received in each election cycle from all energy sector PAC contributions combined.

Figure 8: Average Energy Sector PAC Contributions Per Member Per Cycle.

The data in Figure 8 suggests that the average legislator receives considerable support for their campaigns from energy sector PACs. This figure, however, masks the variation across parties in support from the energy industry. Figure 9 below shows the dramatic cross-party variation in support from the energy industry. We can draw from Figure 9, that Democrats received substantially less money from the energy sector. For example, in the 2012 election cycle Democrats received approximately a third of what Republicans did.

We also observe substantial inequality across energy sector PACs in how much money they contribute to congressional campaigns. Figure 10 highlights the money that the seven PACs that comprise the top 2% of energy PACs. The most active energy sector PAC in the 2012 cycle was the Bechtel Company PAC

Figure 9: Cross-Party Differences in Campaign Contributions from Energy Sector PACs. Note that these contributions are stacked, so the amount the Democrats received appears directly above the amount Republicans received.

which contributed well over half a million dollars to members of Congress in that cycle. These differences across energy PACs and the often diverging goals of competitor companies suggest a promising area of future research is to specifically link a company’s PAC contributions to the companies and projects mentioned in the congressional letters to FERC. In the concluding section of this paper we discuss how we plan to pursue this line of research in the future.

11.2 Preliminary Results: Relationship between Letter-writing and Campaign Contributions

In the preceding section, we established that taken collectively energy sector political action committees have been spending substantial sums of money on congressional campaigns. Earlier in this paper we observed considerable variation in legislator’s letter-writing to FERC in terms of number of letters, whom the legislator is advocating on behalf of, and what the letters are about. In this section of the paper we bring these two sets of data together to begin exploring the relationship between letter-writing and campaign contributions from energy industry political action committees. In Figure 11 below we see the coefficient and 95% confidence

Figure 10: Unequal Money Across Energy Sector PACs. The seven PACs that comprise the top 2% of energy PACs contribute a disproportionate share of the energy industry’s contributions. The contribution activity of those PACs across election cycles is highlighted in individual colors.

intervals for energy industry PAC contributions on letter-writing activity to FERC. These are bivariate ordinary least squares regression models in which each color represents a different dependent variable (type of letter). The full regression tables for this model are in Table A1 in the Appendix.⁹

Figure 11: Bivariate Models - Campaign Contributions and Letter-writing to FERC. These figures show the point estimate and 95% confidence intervals for the energy industry PAC contributions on letter-writing activity to FERC. Each color represents a different dependent variable (type of letter). The full regression tables for this model are in Table A1 in the Appendix.

⁹Frequently, the literature on campaign contributions posits non-linear relationships, and in particular we often see natural log transformations implying diminishing effects of money as the amounts increase. Table A3 in the Appendix shows the same bivariate contribution models, but with the contribution amounts transformed using natural logs. Table A4 in the Appendix shows the same bivariate contribution models, but with total amount of money received from the industry over a member’s entire career.

The bivariate campaign contribution and letter-writing regression results in Figure 11 show a positive relationship for overall letter-writing to FERC per cycle and Pro-Business Letter-writing to FERC per cycle. They show a somewhat weaker relationship between Anti-Business Letter-writing to FERC, and no relationship between non-constituent letters and campaign contributions. In terms of magnitude of the effect size, the model suggests that a \$1 million dollars in contributions from the energy sector PACs would yield 3.5 letters written to FERC in that cycle.

Turning from campaign contributions to party relationships, we observed large partisan differences in letter-writing activity earlier in the paper in Figure 4. In Figure 12 below we see a bivariate party model looking at the relationship between being a Republican and writing letters to FERC.¹⁰ The results in Figure 12 show stark partisan differences in letter-writing. We see Republicans writing a lot more pro-business letters than Democrats, and writing many fewer anti-business letters than Democrats.

Figure 12: Bivariate Models - Party Membership and Letter-writing to FERC. These figures show the point estimate and 95% confidence intervals for being a Republican legislator on letter-writing activity to FERC. Each color represents a different dependent variable (type of letter). The full OLS regression model is available in Table A2 in the Appendix.

Next we bring both party membership and energy industry PAC contributions into a multivariate model predicting letter-writing activity to FERC. Figure 13 shows the point estimates and 95% confidence intervals for the coefficients in the multivariate OLS model with both party and energy industry PAC contributions.¹¹

By including both legislator party and energy industry campaign contributions we see in Figure 13, that energy industry contributions positively predict total letter-writing and pro-business letters, while they appear to have no effect on anti-business letters. Conversely, we find Republicans write fewer anti-business letters and total letters than Democrats.

¹⁰The full OLS regression model is available in Table A2 in the Appendix.

¹¹The full regression table is available in Table A5 in the Appendix.

Figure 13: Multivariate Models - Campaign Contributions, Party and Letter-writing to FERC. These figures show the point estimate and 95% confidence intervals for the coefficients in the multivariate OLS model. Each color represents a different dependent variable (type of letter). The full regression table is available in Table A5 in the Appendix.

12 Conclusion

Building on Arnold (1979)’s insights into how bureaucrats and legislators *anticipate* how others will react to their actions we explored a new form of signalling and learning by examining congressional letters to the Federal Energy Regulatory Commission. While our empirical results are preliminary, we see evidence consistent with the idea that energy industry campaign contributions lead to more over-all letters to FERC, and specifically more pro-business letters to FERC.

We believe this paper represents a starting point for what we can learn about legislator motivations and the impact of money on congressional and bureaucratic relations. In future work we hope to expand our analysis to other agencies, but also other forms of campaign contributions (super PACs, independent expenditures, lobbying data, etc). We also hope to look at the impact of the legislator’s letters on the actions taken by the agency – in particular we hope to focus on the speed of the review by FERC as an outcome, as that is frequently what companies are asking for in these requests.

Finally, we think one of the most promising areas of future research is connecting company specific campaign contributions to FERC letters. On the surface it would seem that it would be relatively straightforward to connect political action committees associated with individual companies to the companies that are mentioned in legislators’ letters to FERC. The Federal Election Commission’s rules require that the PAC’s name include the full name of the connected organization (sponsoring company or organization) must appear in the name of the SSF. However, one challenge in this industry area is that if a connected organization has parent companies or subsidiaries those names don’t need to be included in the name of the PAC. Thus we need to link the companies to their subsidiary/parent companies. In addition, the letters to FERC often simply mention the name of an Energy Project that is being developed by a company, and

don't always include the full sponsoring company in the letter. So to be complete, we need to link parent companies, subsidiary companies, and relevant energy projects.

As an example of the challenge of connecting corporate PACs to companies and projects mentioned in FERC letters we will consider the Williams Company. The Williams Company is a Fortune 500 energy company based in Tulsa, Oklahoma whose primary business is natural gas, but also has subsidiary parts that cover petroleum and electricity generation (Bloomberg, 2019). The Williams Company PAC has been an active contributor to congressional campaigns in recent cycles. In the 2016 election cycle the Williams Company PAC contributed \$392,000 to congressional candidates with 7% going to Democrats and 93% to Republicans.

Connecting these contributions to letters written by members of Congress on behalf of the company is more challenging. The Williams Company also own the Transcontinental Pipeline Company, the Transcontinental Gas Company, and the Transco Pipeline Company. In addition, they're the company behind a large number of projects such as the Atlantic Sunrise Project, and the Northeast Supply Enhancement (NESE) Pipeline, among many others. Unfortunately, for our purposes here, the name Williams doesn't appear in their subsidiary companies. Nor does the name Williams appear in the energy projects undertaken by the company. To attempt to link parent companies that have corporate PACs that make campaign contributions like the Williams Company to the projects and subsidiary companies mentioned in the letters, we plan to draw on a combination of news reports and company filings with the Securities Exchange Commission.

While the projects we have outlined here comprise an ambitious research agenda, we believe they represent a collection of concrete steps that will help advance our knowledge in this area. Moreover, we believe that taken together we can use them to build on the foundational insights of Arnold (1979) to better understand the strategic anticipation and signalling that takes place between legislators and bureaucrats.

COMMITTEES:
NATURAL RESOURCES AND
ENVIRONMENTAL AFFAIRS
NATURAL RESOURCES
ARMED SERVICES
SPECIAL COMMITTEE
ON ASIAN

PO Box 655
Bangor, ME 04402
April 28, 2008

Mr. Mark Whitenton
Director, Division of Congressional and
Federal Energy Regulatory Commission
888 First Street, NE, Room 11H
Washington, DC 20426

Fax: (202) 208-2106

Dear Mr. Whitenton:

Senator Collins has been contacted by [REDACTED] Agent for Wilsons on Moosehead Lake in Greenville Junction, ME with a request for assistance. [REDACTED] expressed concern that Florida Energy and Light is attempting to take over the driveway of his business and make it a public way. [REDACTED] states that turning the driveway into a public way would cause his business great hardship and asked that the Federal Energy Regulatory Commission intervene on his behalf.

Senator Collins has a strong desire to be responsive to constituent requests; with this in mind, I have taken the liberty of providing a copy of [REDACTED] letter to Senator Collins to you. Please review this matter and provide any appropriate assistance to assure that his concerns are addressed.

Thank you for your help; if you have any questions, or need additional information, please do not hesitate to contact me at (207) 945-0417.

Sincerely,

Deidre Anderson
Staff Assistant to
Susan M. Collins
United States Senator

RE: Dominion Energy
Supply Header Project
Docket No. CP15-555-000

Dear Chairman Chatterjee,

I am writing to express my support for the Dominion Energy, Supply Header Project that is passing through West Virginia and will improve the transmission of natural gas throughout the region.

With your recent appointment, there are many shovel ready projects that will be of great benefit to West Virginia. I know you share my concern regarding the significant backlog of project approvals—and I know you will work diligently to get these projects moving forward.

These projects in and around West Virginia stand to create over 49,000 good-paying jobs and will help jumpstart the economy in the region.

I hope that the Commission will ensure that local landowner and community interests will be carefully vetted to ensure that the project is completed in a safe and efficient manner.

I support the Dominion Energy, Supply Header Project project and hope you will act swiftly to approve this important project.

Sincerely,

Alex X. Mooney
Member of Congress

Washington, D.C. 20426

RE: Sabal Pipeline PF14-1

Dear Commissioner Moeller,

It has been brought to my attention that in a recent report submitted into the official docket (Access No. 20140910-5159) Sabal Trail has included the following statement located under the Routing/Alternatives Update Section of their report:

“Sabal Trail evaluated the requested changes in the proposed pipeline route on Graham properties and an acceptable route was developed.”

While access was granted to Sabal Trail to conduct civil, environmental and cultural surveys, I would like the record to reflect that Graham Angus in no way supports the route proposed across farm property and has made no such requests or agreements with Sabal Trail regarding this matter.

I appreciate your attention to my concerns and look forward to your confirmation that the matters addressed in this letter have been correctly reported.

Sincerely,

Bob Graham

CC: Acting Chairman Cheryl A. LaFleur
Commissioner Norman C. Bay
Commissioner Tony Clark
